Providing safe, fun, all-weather playground surfaces for schools and nurseries across the UK

School playgrounds are the places where friendships are made, and games are played. Ensuring that your school or nursery has a playground surface that is both hardwearing and safe is vital for the protection of your pupils. At Edspace we are dedicated to providing safe and high-quality surfacing solutions that meet all your playground needs.

All the playground surfaces we provide are designed for active children and are impact-absorbing to minimise the risk of injury in case of trips and falls. Our surfaces meet and exceed industry standards and provide a comfortable and protective surface for pupils to play on.

Edspace understands that choosing a surface for something as important as a playground, multi-sport area or activity area can be a daunting task, which is why we offer a friendly consultation to make sure you get the correct surface type for your requirements and budget.

Browse through this brochure to learn more about our products, their features and benefits, which we hope will help you make an informed decision for your playground.

At Edspace we are dedicated to providing safe and high-quality surfacing solutions that meet all your playground needs.

Wet Pour Rubber playground surfaces

Our wet-pour rubber surface is hugely popular in education establishments across the UK as it provides an impact absorbing surface and makes the area a safer place in which to play.

All the schools and nurseries we work with have loved the fact that surfaces can be laid in many colours and designs.

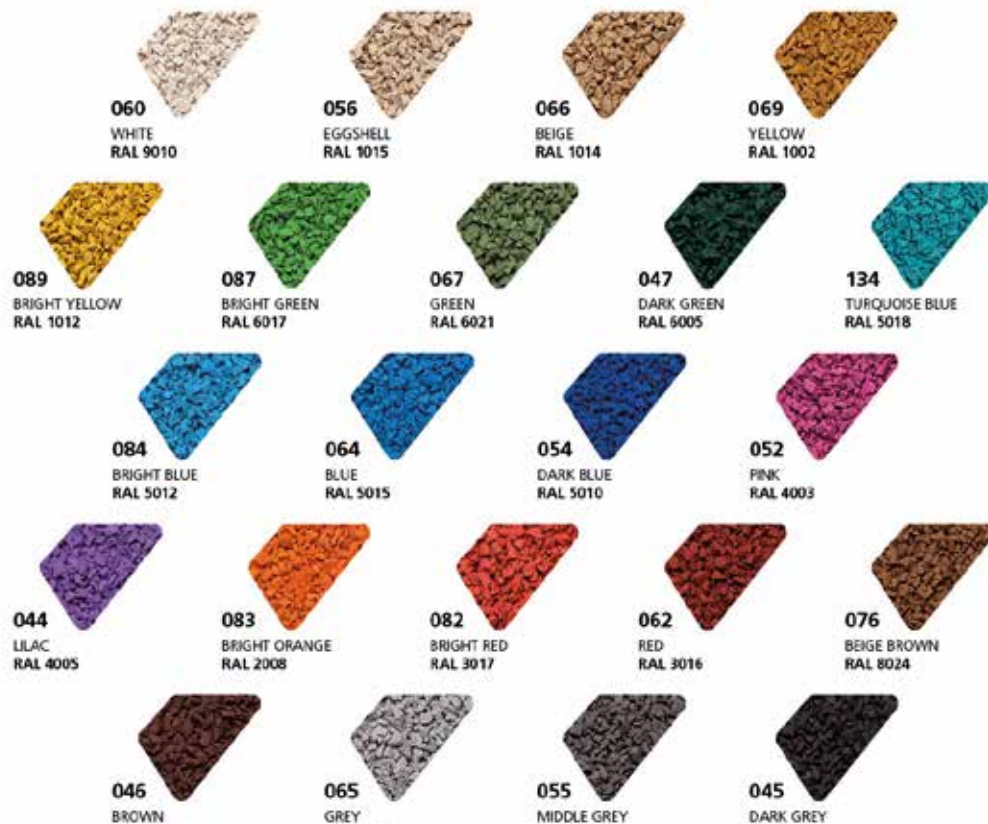

We've created hopscotch grids and racetracks to give children stimulation for active play and the chance to hone fine motor skills and coordination as they enjoy brightly coloured flooring activities.

Wet Pour Rubber - colour options

Wet-pour rubber surfacing is extremely versatile and bespoke designs and themes are easily achievable using the wide range of colours that we offer.

Wet pour rubber is also a safer surface to use around play equipment or climbing walls as it helps to absorb impact from falls from heights, minimising the risk of injury. We'll offer a range of surface depths and will advise you on the correct depth needed to suit the fall height requirements of the playground equipment it is surrounding.

Forest Floor Mulch playground surfacing

Not only does forest floor mulch look aesthetically pleasing in a natural environment.

This all-weather playground surface is formed using a polyurethane-bound rubber mulch, giving it a natural appearance. If budget is a key driver when specifying your playground surface, speak to our team about the forest floor mulch option.

Artificial Grass play area surfaces

There are many benefits as to why artificial is better than the real thing.

A growing number of UK schools and nurseries are creating artificial grass play areas for their pupils. There are many benefits as to why artificial is better than the real thing.

Made from synthetic materials designed to imitate the look and feel of natural grass, this surfacing is incredibly low-maintenance with very high durability.

Unlike natural grass, synthetic turf does not require watering, mowing, or fertilizing, making it a convenient option for busy playgrounds. The surface can be used in all weather conditions, providing a consistent playing surface year-round – even during the wet winter term!

It's also a great alternative in areas where natural grass would struggle to thrive and opens up a new area for activity, especially in smaller schools or city schools where space is at a premium.

An additional benefit of artificial grass over natural grass is the fact that artificial grass does not attract pollen or other allergens, making it a good option for children with allergies.
